

Press Release

A head start for Kampmann customers

New EC technology for Ultra unit heaters produces more output and requires lower energy consumption. And with Kampmann service, customers have a significant head start ahead of their competitors in the market.

Lingen (Ems), 28.06.2011 – With new EC technology, Kampmann project partners can give their customers a major head start in terms of development and they will immediately benefit from noticeable energy savings. What's the reason for this? EC technology enhances direct current motor technology, even at lower output levels. Kampmann will be successively equipping all products with this technology and, in addition to Ultra unit heaters, Powerkon high-output heaters, Katherm QK/HK floor duct heaters and Venkon fan convectors will be the next products in line.

Major benefits for Ultra

The Kampmann classic Ultra unit heater is synonymous with extensive product innovations: even quieter, even better output, even faster delivery and even the standard model provides outstanding heat distribution. Kampmann achieves this with individually adjustable, further lengthened air output louvres. Ultra unit heaters are perfect for installation in commercial and industrial buildings.

Service takes the pressure off customers

Both in terms of advice and service, Kampmann project partners can take advantage of Kampmann's decades of expertise. This can be seen in the wealth of individual system solutions and conscientious project and customer advice. With the pressure taken off, customers

will surprisingly free up time in their day to day working lives.
